Test Report

Test Description

Perform MIL-STD-810D environmental testing on supplied Pro V & V (Dominion) Voting system components, as per quotation CM380832205802, and customer's additional instructions by email.

Test and Setup Procedures

General Setup Description

Samples provided by the customer were tested as per the following test sections. Refer to the Sample Description and Quantities section, for specific details regarding each sample number.

Shock - Bench Handling (MIL-STD-810D, 516.3, I-3.8)

Pro V&V samples 1, 2, 5 and 6 were used Pro V&V samples 1 to 6 were used for Shock – Bench Handling tests. Samples were dropped on their edges, as agreed upon with the customer. Using one edge as a pivot, the opposite edge of the chassis unit was lifted until the face reached 45° with horizontal bench top, or 4 inches above bench top (whichever occurred first). This was repeated with each practical edge, of the same horizontal face. Refer to Appendix A: Shock Setup & Data.

Vibration – Basic Transportation (MIL-STD-810D, 514.3, I-3.2.1)

Pro V&V samples 1 to 6 were used for Vibration – Basic Transportation testing. Vibration was performed at ambient/room temperature (20°C +/- 3 °C) in the X, Y and Z axis as per Table 1 (below).

Table 1: Vibration Profiles

Refer to Appendix B: Vibration Setup and Data.

Low Temperature - Storage (MIL-STD-810D, 502.2, II-3)

Pro V&V samples 1 to 24 (plus accessories) were used for Low Temperature - Storage testing. Samples were soaked at a temperature of -4°F (-20°C +/- 3 °C) for a duration of 4 hours, after which operation was confirmed by the customer. Samples were not powered, and were soaked in their packaging for the duration of the test. They were removed from the boxes for operational verification after the test. Refer to Appendix C: Low Temperature Setup and Data.

High Temperature - Storage (MIL-STD-810D, 501.2, I-3.2)

Pro V&V samples 1 to 24 (plus accessories) were used for High Temperature - Storage testing as per procedure I. Samples were soaked at a temperature of 140°F (60°C +/- 3 °C) for a duration of 4 hours, after which operation was confirmed by the customer. Samples were not powered, and were soaked in their packaging for the duration of the test. They were removed from the boxes for operational verification after the test. Refer to Appendix D: High Temperature Setup and Data.

Humidity – Hot/Humid (MIL-STD-810D, 507.2, I-3.2)

Pro V&V samples 1 to 24 (plus accessories) were used for Humidity testing as per Procedure I – Hot/Humid. Samples were soaked as per Table 507.2-I, Hot-Humid (Cycle 1), for a duration of 240 hours (10 days), after which operation was confirmed by the customer. Samples were not powered/operational, and were soaked in their packaging for the duration of the test, and were removed from the boxes for operational verification. Refer to Appendix E: Humidity Setup and Data.

Temp-Power Variation Testing (MIL-STD-810D, 501.2/502.2)

Pro V&V samples 1 to 24 (plus accessories) were used for Temp-Power Variation testing. Samples completed 85 hours as per the following environment profile (Table 2 – below).

Table 2: Temp-Power Variation Profile

1- Ramp to 10°C
2- Hold 10°C for 12 hours
3- Ramp to 35°C over 1 hour
4- Hold 35°C for 12 hours
5- Ramp to 10°C over 1 hour
6- Repeat until 85 hours cycling at profile is achieved
7- Ramp to 35°C over 1 hour
8- Hold 35°C for 12 hours
9- Ramp to 23°C over 1 hour
10- Hold for duration of test

Samples were powered and being operated by the customer for the duration of the environmental profile, to confirm operation. Refer to Appendix F: Temp-Power Variation Setup and Data.

Summary of Test Results

Shock - Bench Handling (MIL-STD-810D, 516.3, I-3.8)

Pro V&V samples 1, 2, 5 and 6 were used Pro V&V samples 1 to 6 were used for Shock – Bench Handling tests. Samples completed the required drops on each edge without any signs of visual damage, and customer stated they remained functional. Refer to Appendix A: Shock Setup & Data.

Vibration – Basic Transportation (MIL-STD-810D, 514.3, I-3.2.1)

Pro V&V samples 1 to 6 were used for Vibration – Basic Transportation testing. Samples completed the required vibration in the X, Y and Z axes without any signs of visual damage, and customer stated they remained functional. Refer to Appendix B: Vibration Setup and Data.

Low Temperature - Storage (MIL-STD-810D, 502.2, II-3)

Pro V&V samples 1 to 24 (plus accessories) were used for Low Temperature - Storage testing. Samples completed the required soak without any signs of visual damage, and customer stated they remained functional. Refer to Appendix C: Low Temperature Setup and Data.

High Temperature - Storage (MIL-STD-810D, 501.2, I-3.2)

Pro V&V samples 1 to 24 (plus accessories) were used for High Temperature - Storage testing as per procedure I. Samples completed the required soak without any signs of visual damage, and customer stated they remained functional. Refer to Appendix D: High Temperature Setup and Data.

Humidity – Hot/Humid (MIL-STD-810D, 507.2, I-3.2)

Pro V&V samples 1 to 24 (plus accessories) were used for Humidity testing as per Procedure I – Hot/Humid. Samples completed the required soak without any signs of visual damage, and customer stated they remained functional. Refer to Appendix E: Humidity Setup and Data.

Temp-Power Variation Testing (MIL-STD-810D, 501.2/502.2)

Pro V&V samples 1 to 24 (plus accessories) were used for Temp-Power Variation testing. Samples completed the required 85 hours without any signs of visual damage, and customer stated they remained functional for the entire duration of the cycle. Refer to Appendix F: Temp-Power Variation Setup and Data.

Test Equipment & Uncertainty

Equipment Description	Gauge ID	Measurement Uncertainty (K Factor = 2, 95% Confidence Level)
